
Clinical Drug Trials

NAHA Health provides an end-to-end solution for clinical trials that enables real-time sharing of data between the physician, nurse and study coordinator. Our paperless clinical trial platform reduces data errors, streamlines regulatory workflows, accelerates timelines and is HIPAA-compliant. We can support a clinical trial model in which a patient participates in the trial from home or in a controlled clinical environment. Our team can provide assessments to determine the clinical and behavioral health status of the patient prior to starting the clinical trial. Any patients with increased risk will be more closely monitored for their safety throughout the trial by their dedicated NAHA Health nurse. The platform development and data automation is driven by your clinical trial requirements.

Examples of Capabilities:

- Eligibility call preformed by a nurse
- Physician data is electronically captured
- Paper records can be digitized
- Dedicated nurse for each participant
- On-going quality of life assessments through completion of trial
- Clinical health risk assessments to determine risk level of participants
- Behavioral health depression screening

Examples of Electronic Data Collection:

- Physician assessments/ checklists
- Participant questionnaires / surveys
- Nurse facilitated assessments
- Electronic participant journaling
- RPM physiological data collection
- Real-time nurse evaluation of data
- Customized web or app platform

The user interface is designed based on your clinical trial's needs

As your clinical trial partner, we will develop a customized nurse monitoring program that will maximize the safety of your study participants. Together we will create a customized end-to-end interface to monitor participants, collect real-time data and digitize reporting for seamless execution.

Our nurse care team can facilitate questionnaires and quality of life checks throughout the trial

The NAHA team is trained in the field of medical research. We can oversee medical questionnaires, surveys or quality of life assessments before, during, after or as-needed during the trial. Additionally, we can monitor the behavioral health status of participants throughout the trial for safety.
